Integware Provides GxP (Good Practice Quality) Services and Solutions to all Industries

The company expands its offering and skillset to provide a solution that scales all industries and provides adherence to good quality practices

FORT COLLINS, CO, July 25th, 2012 – [Integware](http://www.integware.com), the leader in deploying PLM services and solutions for the medical device industry, today announced another expansion in its lineup of offerings. Integware has been delivering GxP (Good Practice Quality) services and Quality Management System (QMS) solutions to the life sciences industry for over 16 years, and has seen many non-life sciences companies benefit from the value they are providing. Integware's GxP solutions span multiple processes and provide end-to-end value with complete traceability and accountability through the entire product lifecycle.

“We are bringing a total solution offering to companies who want to follow current good quality practices in research, design, and manufacturing. This is not only to satisfy GxP-driven regulations, but all companies who want to do business the right way”, stated Chris Kay, CEO of Integware.

Integware's GxP solutions and services have been deployed in some of the largest manufacturing companies in the world. These solutions enable compliance with regulations, decrease time-to-market with a focus on ROI and efficiency, and reduce Total Cost of Ownership (TCO).

“Customers don't want to adopt another technology or install another piece of software that helps them solve a single problem; they want to transform the way they do business by having traceability between all key product-related processes. Our customers want to increase their margins, while at the same time improving speed, quality, and compliance. Our solution enables full process integration of all your product-related processes throughout your supply chain so our customers can deliver the absolute best products while meeting their profit margin targets”, continued Kay.

“You have to work much smarter or you are going to be left in the dust. Products must be produced at a much lower cost and at a much higher level of quality than ever before. This is what you get by embedding PLM-driven GxP throughout the product lifecycle, adoption is no longer going to be optional if you want to maintain any kind of margin. Thankfully the technology has also greatly advanced to help companies rise to this challenge. What's possible

now with PLM-driven GxP just didn't exist even just a few years ago", stated Dave Hadfield, Director of Client Transformation for Integware.
