New discovery, ISO-Extracts™ turns-on plant growth while improving soil health and sustainability of our food supply.

PHOENIX, ARIZONA - Today, Beem Biologics, Inc. is announcing the discovery of ISO-Extracts™, a natural biological complex applied to plants by spray or irrigation.

Lance Beem, Chief Science Officer and a 35-year veteran in the crop protection industry, made these multiple discoveries of the *ISO-Extracts™* in early field trials to treat nematodes. The impact on plant health and increase in flowers, fruit and seed, became evident while initially testing the complex for plant pest control. As important as the plant protection aspects of these compounds are, it has also been documented these compounds significantly increase plant health and yields. A series of patents were filed and expanded field trials are currently on-going in the US and South America.

According to Beem, *ISO-Extracts™* will add a significant tool to growers adopting sustainable growing practices for conventional and organic crops. *ISO-Extracts™* work well in combination with synthetically derived chemical compounds and formulations.

Field trials through university, private research firms and in-house studies over the past 24 months confirm *ISO-Extracts™* significantly promote healthy, yet rapid growth, fruiting and higher yields in agriculture, hydroponic, turf and landscape crops.

According to Stephen Butler, CEO, "Commercial field trials which began in 2014, indicate high efficacy with low application rates of 1 – 3 pints per acre per crop cycle. Performance and cost are the key benefits of *ISO-Extracts™* and make this discovery a real 'game changer' in crop production."

Beem Biologics, Inc. was incorporated in 2015, to commercialize this patent-pending discovery. The company has a research facility in Woodland, California and a processing and manufacturing facility in Arizona. Initial funding for research, trials, and regulatory compliance came from a seed capital round completed in 2015.

The Company will offer *ISO-Extracts™* in organic and synthetic fertilizer formulations beginning in the fall of 2016. In addition, BBI is offering *ISO-Extracts™* formulations to crop protection industry manufacturers through license agreements. For an introductory package, go to: www.beembio.com.

About Beem Biologics

Beem Biologics, Inc (www.beembio.com) is a product developer and manufacturer of biological compounds for the crop protection industry. Through discovery, product development and trials, BBI developed isoprenoid compounds ("*ISO-Extracts™*") derived from desert, mountain and sea plants that are highly effective, economical to use, and have broad application in various formulations for fertilizer, stimulant and pesticides.
