

## StratusLink Overview

StratusLink is a patent pending healthcare data management platform designed for Post-acute Care Providers and their partner networks. The platform is optimized for efficiently retrieving and organizing large data sets and handling complex analytical queries.

StratusLink operates separately from EHRs and other healthcare information systems and *does not compete with either*.

It is the only platform that aggregates and integrates clinical, financial and operations data regardless of source or format and eliminates the wait (and possibly the need) for traditionally defined "interoperability" solutions.

StratusLink unifies all data into proprietary single-source-of-truth longitudinal patient records that are centrally accessible from a cloud-based vendor neutral archive (VNA). The platform includes advanced search-based analytics that enable KPIs to be built on-the-fly and maintains a growing library of KPIs aligned with CMS Quality Measures.

StratusLink enables health information exchange (HIE) across the organization as well as across the continuum of care. It eliminates the need to change or optimize EHRs and costly IT infrastructure and requires no additional IT staff. StratusLink is a SaaS platform that can be up and running in 120 days.

By providing 360° visibility across the organization, StratusLink delivers the data-supported clinical, financial and operations metrics that decision makers need to improve performance in response to:

- Declining revenues and reimbursements
- Federally mandated pay-for-performance models
- Evolving structured quality measures
- Market consolidation and higher quality and lower cost demands from consumers, partners and payers
