Cloud Video Surveillance and Analytics

Reliable and secure cloud-based solution for video surveillance and smart home monitoring

We provide a "cloud-first" (AWS) approach for surveillance systems along with machine-learning analytics to maximize revenue for Security Integrators and provide the best end-user experience

AWS Cloud

The most secure and reliable cloud solution on the market

Cost-Effective Solution

Add any camera or NVR/DVR without the need of additional hardware or software

Complete White-Label

Including the admin and video portals, and native iOS & Android apps

Next Generation VMS

3dEYE is a professional cloud-based video monitoring platform operating on a modern redundant cloud architecture providing an HTML5 Web Browser video interface and comprehensive mobile applications for IOS and Androld. 3dEYE operates via AWS, the best cloud technology in the world for redundancy and data security but can also utilize any cloud technology including custom cloud. This solution is affordably scalable and flexible as

any ONVIF supported IP and open platform cameras can quickly be configured without additional hardware or software. Cameras and servers can be subscribed to a pay-as-you-go AWS cloud subscription starting at \$2 or be licenced for hybrid and/or local storage.

Manage cameras and NVRs, both cloud and local sites, dealers and customers all through our *admin portal* including powerful system alerts and rich user permissions.

Unlike traditional Video Management Software, 3dEYE provides the freedom to connect and deploy installations on **any type of device** and allow users to login on the web or mobile to access the video the lowest latency stream from anywhere, and anytime.

It is now easier than ever before to simultaneously view and synchronize numerous streams, save and download clips and time lapses, and find events using filters with minimum clicks on any web browser, computer or mobile device

Cloud Analytics

Utilize the power of cloud processing to layer advanced cloud analytics alongside common camera-side analytics to provide an enhanced user experience. 3dEYE cloud analytics enable users to set rule-based analytics with subsequent custom alerts for email or app push notifications during a set schedule for select users.

Our machine-learning systems are constantly updating object classification algorithms in real-time based on all enabled cameras, locations and conditions (network effect). 3dEYE creates multiple models for buckets of cameras with similar images and analytics in order to make searches more precise and avoid single large generalized models - object classification models are constantly retraining and evolving. 3dEYE utilized two leading machine learning frameworks, tensorflow and pytorch/caffe by Google and Facebook machine learning and intelligence teams.

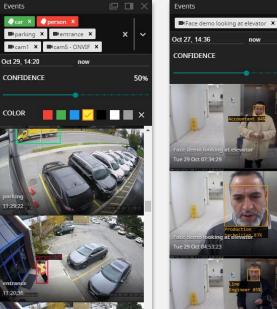

Rule-based cloud analytics allow users to detect, track and classify subjects such as Car or Person (including skin color, height or gender) as well as any other 110+ categories available through COCO dataset and ImageNet. In addition, users can enable Heat Maps and Facial Recognition, including setting alerts for whitelist and blacklist of faces.

Please inquire separately for specialized modules such as LPR, Speed Detection and People Counting.

Quickly identify useful information using intelligent analytics features

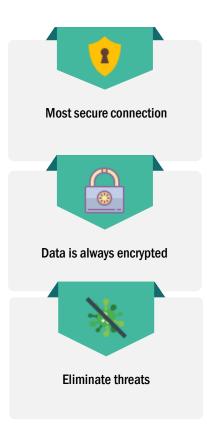

× V

Plug & Play (PUSH Module)

3dEYE developed a unique Push Module solution, allowing cameras to connect **directly to the cloud over HTTPS tunnel** (443 TCP Connection). This configuration is extremely secure and reliable as there are **no intermediate servers** (3rd party P2P Stun and Turn servers do not support continuous streaming). This connection **eliminates security vulnerabilities** with cameras often being exposed to internet hacking threats over port forwarding. No public access is possible to Push Module connected cameras.

Unlike P2P servers, the 3dEYE Push Module does not have issues with ports blocked on ISP providers since it is streaming generic HTTPS traffic.

Currently we support installing this application on open platform firmware cameras such as Axis, Uniview, Hikvision and Vivotek. Push module installation is simple and does not require any IT knowledge, making adding cameras to the 3dEYE admin portal take less than a minute. This can become very valuable at scale as this enables for an easy initial install and migration between sites. Enjoy the flexibility of sending out a configured set of cameras, appearing instantly in the video portal as soon as they are connected to the internet.

Integrations

Our open API system can be integrated into systems such as Sensors, IFFFT, Zapier, Access Control, PoS devices, Smart TV, to form an extremely efficient intelligent surveillance system. In addition, we have integrations with POS, Access Control and Alarm Station.

Point-of-Sale Integration

Announcing in December 2019

Access Control Integration

Aggregate several access control manufacturers using our intermediary <u>Galaxy Control Systems</u> to control access through the video portal and synchronize the access log with video archive.

Alarm Station Monitoring

Push video analytics alerts to any monitoring station provider or take advantage of 3dEYE's built-in <u>alarm</u> <u>station platform</u> to get real-time alerts of predefined rules. Hire your own agents and provide video verification services.

White Label Option

3dEYE is available as a white label service, supporting the ability to tailor the features of the solution to best suit your needs while re-branding the entire product. Included with all monthly pay-as-you-go streaming plans is basic 3dEYE video portal customization such as **changing logos, color scheme and adding your name to the portal sub-domain**. Complete rebranding of video and admin portals, as well as the native mobile apps is also offered.

We also provide development and customization services per your request, allowing you to customize to suit your client's needs.
